1. Overview

Model Launch Control is a web-based dashboard for tracking the tasks, deadlines, and progress involved in launching one or more “models” — think of each model as a project, release, or initiative with its own checklist. It is designed to give a team a single, visual source of truth for how close each launch is to being ready.

The dashboard runs entirely in your browser and can optionally sync to the cloud when you sign in, so your data follows you between devices and can be shared with teammates. If you choose not to sign in, the dashboard works in a local preview mode using your browser only.

1.1 What You Can Do

- Create and track multiple models (projects), each with its own task checklist
- Break any task into subtasks, each with its own status, priority, notes, deadline, and assignee
- Set priorities, due dates, notes, screenshots, and comment threads on individual tasks and subtasks
- Monitor progress with KPI cards (including a live Overdue count), progress bars, and a completion ring
- Filter, search, sort, and bulk-edit tasks — including updates that span every model at once
- Jump to any model or task instantly with Global Search (Ctrl/Cmd+K)
- Compare two models side by side
- Pin your most important models to the top of the dashboard
- Archive completed or paused models without losing their data
- Recover deleted models, tasks, and subtasks from the Recycle Bin for 30 days
- Save a model's checklist as a reusable Template for future launches
- Import and export checklists as Excel workbooks or PDF files
- Generate one-page (PDF) or one-slide (PowerPoint) Executive Summaries for one or all models
- Back up your workspace locally — on demand or automatically every hour — and restore it later
- Review cross-model analytics and team workload
- Invite teammates into a shared Team workspace, assign work, and discuss it in comment threads
- Follow a running Activity Log of every change made to your workspace
- Switch between six themes: Dark, Light, Midnight Blue, Forest, Sunset, and Antigravity
- Sign in to sync your dashboard across devices, or work locally without an account

Tip: Everything in this manual reflects the dashboard's current on-screen labels and icons, so menu names below match exactly what you'll see in the app.

2. Getting Started

2.1 Opening the Dashboard

When you open the page, the dashboard loads immediately with sample preview data so you can explore it right away — you do not need to sign in first. A “LIVE” badge in the top right pulses to show the dashboard is active, and a small timestamp shows when the data was last updated.

If you stay signed out for about 10 seconds, the dashboard will gently prompt you to sign in or create an account. You can dismiss this and continue browsing locally at any time.

2.2 Creating an Account / Signing In

Click the gold Login button in the header to open the sign-in panel.

1. Choose the “Sign In” tab if you already have an account, or “Create Account” to register.
2. Enter your email address and password (passwords must be at least 6 characters). A display name is optional on either tab.
3. Alternatively, click “Sign in with Google” to use a Google account.
4. If you forget your password, use the “Forgot password?” link on the Sign In tab to receive a reset email.

Once signed in, your model and task data is saved to the cloud automatically and will be available the next time you sign in from any device — and can be shared with teammates through a Team workspace (see Section 11).

2.3 Working Without an Account

You can use the entire dashboard without signing in. In this local preview mode, your changes are kept in your browser only — they will not be available on another device and may be lost if you clear your browser data. Sign in at any time to move to cloud-saved mode. You can also protect local work with a manual or automatic backup — see Section 10.4.

3. Dashboard Overview

The main dashboard is organized into a few key areas, from top to bottom:

Area	What it contains
Header	Branding, live status, sign-in/account menu, Global Search, Team, Archived, Recycle Bin, Fresh Start, Undo/Redo, Theme switcher, Export, and Import controls.
KPI Cards	Five summary cards showing totals across all your models: Total Tasks, Completed, Pending, Overdue, and Overall Progress.
Models In Progress	A grid of cards, one per active model, each showing a progress bar, quick stats, and an optional pin.
Task Checklist	The detailed, line-by-line task list — with expandable subtasks — for whichever model is currently selected.
Compare View	An optional side-by-side comparison of two models' checklists.
Analytics View	Cross-model charts, status breakdowns, and team workload.
Footer	Overall completion ring and basic page info.

3.1 KPI Cards

The five cards at the top of the dashboard summarize progress across every active (non-archived) model:

- Total Tasks — the combined number of tasks across all models.
- Completed — how many of those tasks are marked Done.
- Pending — how many are still outstanding (not yet started or in progress).
- Overdue — how many pending tasks have a deadline that has already passed. Click this card to open a list of every overdue task across all models.
- Overall Progress — the completion percentage across all models combined.

3.2 Model Cards

Each model you create appears as its own card in the “Models In Progress” section. A model card shows:

- The model's name and, if set, its target launch deadline
- A colored progress bar showing percentage of tasks completed
- Counts of completed and pending tasks for that model
- A pin icon you can click to keep the model pinned to the top of the grid

Click anywhere on a model card to open that model's detailed Task Checklist below.

Deadline text on a model card changes color as the date approaches: it appears in the normal muted color when there's plenty of time, amber when the deadline is coming up soon, and red if the deadline has passed.

4. Managing Models

4.1 Adding a New Model

1. In the “Models In Progress” section, type a name into the “New model name...” field.
2. Optionally, click the date field and choose a target launch date.
3. Optionally, click “Templates” to start the model from a saved checklist template instead of a blank one (see Section 9).
4. Click “Add Model” (or press Enter in the name field) to create it.

The new model immediately appears as a card and as a tab in the Task Checklist section below, ready for you to start adding tasks.

4.2 Pinning a Model

Hover a model card and click its pin icon to keep that model at the front of the “Models In Progress” grid, ahead of unpinned models. Click the pin again to unpin it.

4.3 Switching Between Models

Use the row of tabs above the Task Checklist to switch which model's tasks you're viewing and editing. The active tab is highlighted in gold. This tab bar sticks to the top of the window as you scroll, so you can always see which model you're working on and switch quickly.

4.4 Setting or Changing a Model's Deadline

With a model selected, click “Set Deadline” (it will read “Edit Deadline” once a date exists) above the task table. Choose a date and click “Save Changes,” or click “Clear Date” to remove it.

4.5 Archiving a Model

Archiving sets a model aside without deleting it — useful once a launch is complete or on hold. Archived models are removed from the main dashboard and KPI totals but can be restored at any time.

1. Select the model's tab in the Task Checklist section.
2. Click the “Archive” button.
3. Confirm the action in the dialog that appears.

To view archived models, open the account menu (click your user badge in the header) and choose “Archived.” A small badge shows how many models are currently archived. From the Archive view, you can restore a model back to the active dashboard or delete it permanently.

4.6 Deleting a Model

Deleting a model removes it and all of its tasks from the active dashboard and sends it to the Recycle Bin, where it can be restored for 30 days before being permanently removed (see Section 13.3).

1. Select the model's tab.
2. Click "Delete Model."
3. Confirm the action in the dialog that appears.

4.7 Comparing Two Models

The Compare view lets you view two models' checklists side by side, which is useful for checking whether similar launches are following the same steps.

1. Scroll to the "Compare Models" panel.
2. Choose a model in each of the two dropdown selectors.
3. Review the combined task list, which lines up matching tasks between the two models and shows completion stats for each.

5. Working with Tasks & Subtasks

5.1 Adding a Task

1. Select the model you want to add a task to.
2. Type the task description into the "Type a new task and press Enter..." field.
3. Optionally, enter a position number in the "Pos." field to insert the task at a specific spot in the list rather than at the end.
4. Press Enter or click "Add Task."

Keyboard shortcut: press N at any time (outside of a text field) to jump straight to the new-task input.

5.2 Task Status: Pending, In Progress, or Done

Each task now carries one of three statuses instead of a simple on/off toggle. Click the status chip in a task's row to open a small menu and choose Pending, In Progress, or Done. Completed tasks move into a collapsible "Completed" section beneath the active list, keeping your pending work front and center.

5.3 Setting Priority

Each task has a priority badge reading HIGH, MED, or LOW. Click the badge to cycle through the three levels. Tasks can also be filtered or sorted by priority (see Section 7).

5.4 Editing a Task's Name

1. Click the pencil icon in the task's Actions column.
2. Edit the text in the inline field that appears.
3. Press Enter or click the checkmark to save, or press Escape to cancel.

5.5 Reordering Tasks

You can reorder tasks two ways:

- Drag and drop a task row to a new position in the list.
- Use the ↑ and ↓ buttons in the Actions column to nudge a task up or down one position at a time.

5.6 Deleting a Task

Click the ✕ icon in the task's Actions column and confirm. The task moves to the Recycle Bin, where it can be restored for 30 days.

5.7 Task and Subtask Deadlines

In addition to a model-level deadline, individual tasks (and their subtasks) can have their own due date.

1. Click the calendar icon next to a task or subtask.
2. Pick a date in the popup.
3. Click “Save Changes,” or “Clear Date” to remove an existing deadline.

Task deadlines are color-coded the same way model deadlines are: neutral when there's time, amber when due soon, and red once overdue. A task with a passed deadline that is still pending also counts toward the “⚠ Critical” filter and the Overdue KPI card.

5.8 Assigning a Task

If your workspace has more than one member (see Section 11), you can assign a task or subtask to a specific teammate. Click the assignee control on the row and choose a name from the dropdown. Use the “My Tasks” filter (Section 7.1) to see only the work assigned to you.

5.9 Working with Subtasks

Break a task into smaller steps by adding subtasks beneath it. Expand a task's subtask panel, type a subtask name, and press Enter to add it. Each subtask has its own status, priority, notes, deadline, assignee, and comment thread — everything a top-level task has.

A task's own status is automatically kept in sync with its subtasks: if every subtask is Done, the task is marked Done; if at least one subtask is Done or In Progress, the task becomes In Progress; if none has any progress, the task falls back to Pending. You can still change a subtask-less task's status manually at any time.

Subtasks can be reordered with drag-and-drop or the ↑ / ↓ buttons, renamed inline, and deleted (which also sends them to the Recycle Bin) the same way top-level tasks can.

6. Notes, Screenshots & Comments

6.1 Task Notes

Use notes to attach extra context, internal links, or details to a specific task or subtask without cluttering the task name.

1. Click the notes icon next to a task or subtask.
2. Type or paste your note into the text box.
3. Click “Save Notes.”

Tasks with a saved note show a highlighted notes icon so you can spot them at a glance.

6.2 Attaching Screenshots

From the same Notes panel, you can attach reference screenshots to a task — useful for design proofs, QC photos, or approval evidence.

- Open the Notes panel for the task and click “+ Add,” or simply paste an image directly into the panel.
- Give the screenshot an optional title so it's easy to identify later.

- Repeat for up to 12 screenshots per task; images are automatically resized and compressed when added.

6.3 Comment Threads

Every task and subtask has its own dated comment thread, separate from the free-form Notes field — useful for a running log of updates (for example, “Supplier confirmed mold completion.”).

- Click the comment icon on a task or subtask row to open its timeline.
- Type your update and press Enter (or Ctrl/Cmd+Enter) to post it.
- Comments are grouped by day and show the author's name and time posted; you can delete a comment you no longer need.

7. Filtering, Searching & Sorting

7.1 Filter Buttons

Above the task table, filter buttons let you narrow the visible list to:

Filter	Shows
All	Every task in the current model
Done	Only completed tasks
In Progress	Only tasks currently marked In Progress
Pending	Only tasks that haven't been started
High Priority	Tasks marked HIGH
Medium	Tasks marked MED
Low	Tasks marked LOW
 Critical	High-priority tasks that are still pending, highlighted in red for urgent attention
 My Tasks	Only tasks and subtasks assigned to you (shown once your workspace has more than one member)

Each filter button shows a live count of how many tasks currently match it.

7.2 Searching Tasks in the Current Model

Type into the search box to instantly filter the current model's task list to matching task names. Press / from anywhere on the page to jump straight to the search box, and Esc to clear the search and any active selections.

7.3 Global Search

To search across every model at once — not just the one you currently have open — press Ctrl+K (⌘+K on Mac) anywhere in the app, or choose “Global Search” from the account menu. Type to filter results live, use the arrow keys to move through them, and press Enter to jump straight to the matching model, task, or subtask.

7.4 Sorting

Click any sortable column header — #, Task Description, Priority, or Status — to sort the list by that column. Click the same header again to reverse the sort direction. An arrow icon next to the header shows the current sort direction.

8. Bulk Actions

To act on several tasks (or subtasks) at once:

1. Check the checkbox on each task row you want to include, or use the checkbox in the table header to select every visible task.
2. A bulk action bar appears, showing how many items are selected.
3. Choose an action from the bar.

Available bulk actions:

- Mark Done / Mark In Progress / Mark Pending — sets the status of every selected item
- Set Deadline — applies (or clears) one due date across the whole selection
- Set Priority — applies HIGH, MED, or LOW across the whole selection
- Move to Top / Move to Bottom — relocates the selection within the current model's list
- Move to Model — relocates the selection to a different model
- Copy to Model — duplicates the selection into a different model, leaving the originals in place
- Duplicate — creates a copy of each selected task within the current model
- Delete Selected — sends the selected items to the Recycle Bin

Click “Clear Selection” to deselect everything without taking an action.

8.1 Bulk Update by Task, Across Models

To make the same change to a matching task in every model at once — for example, marking “QC SIGN-OFF” complete everywhere it appears — open “Bulk Update by Task” from the account menu. Choose the task by name, then apply a status, priority, or deadline change across every model that contains it.

9. Templates

Templates let you reuse a proven checklist instead of rebuilding it for every new launch.

9.1 Starting a Model from a Template

When adding a new model, click “Templates” next to the “New model name...” field to choose a saved template. The new model is created with the template's task list already in place, ready to customize. A “Standard Checklist” template is included by default.

9.2 Saving a Model as a Template

From an existing model, use the “Save as Template” option to capture its current task list (names, priorities, and structure — not statuses, notes, dates, or screenshots) as a new reusable template.

9.3 Managing Templates

Open “Templates” to rename, edit, or delete saved templates from one place.

10. Import & Export

10.1 Exporting All Models

Click the gold “Export” button in the header to export every model at once. The dropdown offers:

- Export as Excel — downloads a workbook with one sheet per model, including task names, priority, status, notes, and dates.
- Export as PDF — downloads a print-ready PDF checklist covering all models.
- Executive Summaries (PDF) — downloads a one-page, presentation-style summary for each model in a single PDF.
- Executive Summaries (PPTX) — downloads a PowerPoint deck with one summary slide per model.

10.2 Exporting a Single Model

With a model selected in the Task Checklist section, click the “Export” button just above the task table to export only that model's checklist as Excel, PDF, or as a single Executive Summary (PDF or PPTX).

10.3 Importing from Excel

You can bring tasks in from a spreadsheet in two ways:

Import into the whole dashboard

Use the “Import” button in the header to upload an Excel workbook. This adds any new models and tasks found in the file while keeping your existing data intact — it will not overwrite or duplicate what's already there.

Import into the current model

With a model selected, use the “Import Excel” button above the task table to add tasks from a spreadsheet (.xlsx, .xls, or .csv) directly into that model.

When preparing a spreadsheet for import, keep one row per task with clear columns for the task name, priority, and completion status; the dashboard will recognize common variations of these column headers automatically.

10.4 Local Backups

Independent of Excel/PDF export, the dashboard can save a full backup of your workspace data (all models, tasks, and settings) to a single local slot.

- Backup Now — available from the Export menu, saves a fresh backup immediately. Only the most recent backup is kept; each new one replaces the last.
- Automatic hourly backup — the dashboard periodically saves a backup in the background while you work, so you always have a recent recovery point without having to remember to make one.
- Restoring — use the restore option next to the backup control to merge a saved backup back into your workspace; this adds back anything missing without duplicating what's already there.

11. Team Workspaces

While signed in, you can share your workspace with teammates so everyone sees and edits the same models and tasks.

11.1 Inviting Teammates

1. Open “Team” from the account menu.
2. As the workspace owner, click to generate an invite code, then share it with your teammate.
3. Your teammate opens “Team” in their own dashboard, enters the code, and joins your workspace.

Once more than one person is in a workspace, a member count badge appears on the Team menu item, and the “My Tasks” filter (Section 7.1) becomes available.

11.2 Managing Members

The Team panel lists every member of the current workspace, with the owner clearly marked. The workspace owner can remove a teammate at any time, which immediately revokes their access to that workspace's tasks.

If you've joined someone else's workspace, use “Back to Personal Workspace” in the Team panel to return to your own data.

12. Analytics

The Analytics view gives you a cross-model picture of launch health at a glance. Open it from the header to see:

- Summary KPIs across every active model, in one place
- A breakdown of tasks by status and by priority
- Team workload — how many tasks are assigned to each member of a shared workspace, and how much of that work is complete

13. Account & Data Management

13.1 The Account Menu

Once signed in, click your user badge (avatar and email) in the header to open the account menu, which contains:

Menu Item	What it does
Global Search	Opens the search-everything modal (Ctrl/Cmd+K)
Bulk Update by Task	Applies the same status, priority, or deadline change to a matching task across every model
Team	Opens the Team panel to invite, view, or remove workspace members
Archived	Opens the Archive view to see, restore, or permanently delete archived models
Recycle Bin	Opens a list of deleted models, tasks, and subtasks that can still be restored
Fresh Start	Permanently deletes all models and tasks, returning to a blank dashboard
Undo / Redo	Reverses (or re-applies) your most recent change; each appears only when available
Sign Out	Signs you out of your account

13.2 Undo and Redo

Most changes — completing a task, deleting a task, reordering, and similar actions — can be undone, and an undone change can be redone.

- Undo — click “Undo” in the account menu, the Undo button on the confirmation toast that appears after a change, or press Ctrl+Z (⌘+Z on Mac) anywhere outside a text field.
- Redo — click “Redo” in the account menu, or press Ctrl+Y (or Ctrl+Shift+Z / ⌘+Shift+Z on Mac) anywhere outside a text field.

13.3 Recycle Bin

Deleting a model, task, or subtask no longer removes it outright — it moves to the Recycle Bin, where it is kept for 30 days before being purged automatically. Open “Recycle Bin” from the account menu to restore an item back to where it came from, or to empty the bin and delete everything in it permanently right away.

13.4 Fresh Start

“Fresh Start” clears every model, task, deadline, template, and archive entry, returning the dashboard to a completely blank state. Because this is permanent and cannot be undone, you will be asked to confirm before anything is deleted.

13.5 Activity Log

The dashboard keeps a running log of changes — tasks completed, deadlines set, models archived, comments posted, and more — so you can see what happened and when. Open it from the notification bell in the header, which also flags unseen activity. From a log entry you can jump back to see the workspace state right before that change was made.

13.6 Theme

Click the “Theme” button in the header to switch between six appearances: Dark, Light, Midnight Blue, Forest, Sunset, and Antigravity. Your preference is remembered for future visits.

13.7 Staying in Sync

While signed in, your changes save automatically in the background, and the “Last updated” timestamp in the header reflects the most recent save. If your connection drops, the dashboard keeps working locally and will let you know that your changes are saved on your device for now until the connection is restored.

14. Keyboard Shortcuts

These shortcuts work anywhere on the dashboard except while typing in a text field (unless noted):

Shortcut	Action
N	Jump to the “new task” input field
/	Jump to the current model's search box
Ctrl+K (⌘+K on Mac)	Open Global Search — works even while typing in most fields
Esc	Clear search, clear task selection, and close open menus or dialogs
Ctrl+Z (⌘+Z on Mac)	Undo the most recent change
Ctrl+Y or Ctrl+Shift+Z (⌘+Shift+Z on Mac)	Redo the most recently undone change
Enter	Confirm/save the field currently being edited (task name, new task, new model, comment)

15. Tips & Best Practices

- Use the “ Critical” filter regularly to surface high-priority work that's still outstanding before a launch.
- Set both a model-level deadline and individual task deadlines for any task that has its own hard cutoff (e.g., a review or sign-off date).
- Break large or multi-owner tasks into subtasks so each piece can be assigned, dated, and tracked on its own.
- Pin the models you're actively driving so they're always the first thing you see.
- Turn a well-run launch's checklist into a Template so the next launch starts from a proven structure instead of a blank page.

- Archive models as soon as they're complete to keep your active dashboard and KPI totals focused on current work.
- Export a model to Excel — or save a manual backup — before making major structural changes, so you have something to fall back on.
- Use Executive Summaries when you need a clean, presentation-ready snapshot to share outside the team.
- Sign in (rather than staying in local preview mode) if you want your dashboard available on more than one device, or if multiple teammates need to see and edit the same data.
- Use notes for context that would otherwise clutter a task name — links, owners, or acceptance criteria are good candidates — and attach screenshots for visual evidence like design proofs or QC photos.
- Use comment threads instead of notes for a running back-and-forth discussion on a task, so the note field stays a clean reference rather than a chat log.

16. Troubleshooting

Issue	What to do
Sign-in button doesn't respond / sign-in fails	Check your internet connection. If sign-in services are unavailable, the dashboard will tell you and continue to work in local preview mode; your changes are saved on your device and you can sign in again later.
Changes don't seem to be saving	Look at the “Last updated” time in the header. If it isn't updating, your connection may be unstable; the dashboard will notify you and keep working locally in the meantime. A recent local backup (Section 10.4) can help you recover if needed.
I deleted or changed something by mistake	Use Undo (Ctrl+Z / ⌘+Z, or the Undo option in the account menu) right away — undo is only available for your most recent change. For a deleted model, task, or subtask, check the Recycle Bin instead — items stay there for 30 days.
A model or task I deleted is gone for good	Check the Recycle Bin first — deleted items are kept there for 30 days before being purged. After that (or if the bin has been emptied), the deletion is not recoverable, even with Undo, once you've made further changes afterward. Archiving (for models) is the safer alternative if you might need the data again.
My import didn't add anything	Confirm your spreadsheet has one task per row with recognizable column headers for task name, priority, and status, and that you're importing into the model you expect.
I can't see teammates' changes / “My Tasks” filter is missing	Confirm you're signed in and viewing the correct Team workspace (check the Team panel). The “My Tasks” filter only appears once a workspace has more than one member.
